

# Saperavi - a fascinating standalone wine and a great blender

By Lilian Carter, Winemaker, Symphonia Wines, King Valley, Victoria

## BACKGROUND

**S**ymphonia Wines' founder Peter Read became interested in Saperavi around 1994 when the variety showed up very favourably in wine trials conducted over a few years by Brown Brothers.

In the early 1990s, most growers and winemakers were focusing only on the so-called classic varieties. These varieties came from areas in France and Portugal where the British had a strong trading relationship. There was practically no interest in what we now know as alternative varieties from other European regions.

At the time, Read felt there would be varieties from these countries that would suit the King Valley. He subsequently set about exploring those regions that appeared to have climates similar to that of the King Valley. He visited most of the climatically similar areas of Western Europe, but unfortunately was unable to visit the equivalent Eastern European regions. However, his desk work suggested that the Kakheti region of Georgia was climatically similar to the growing season in the King Valley.

As the best Saperavi wine came from this part of Georgia, Read added it to his wish list. It is also worth noting Saperavi is the most widely planted red variety in the former USSR countries where it has a number of uses.

Peter Read sourced the Saperavi planting material for his Symphonia vineyard at Myrree from Mark Walpole's Whorouly vineyard in north-east Victoria,

**The majority of the Saperavi vines in the Symphonia vineyard, at Myrree in Victoria's King Valley, were top grafted from Cabernet Sauvignon on Schwarzmann rootstock nearly 20 years ago.**

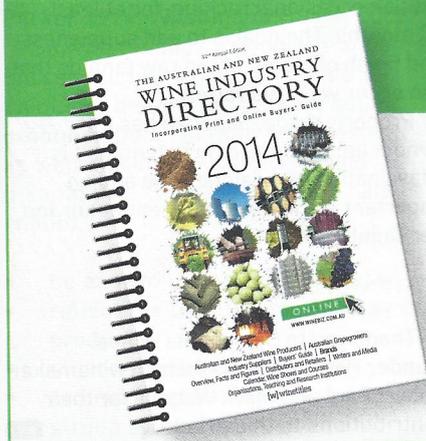

from where Brown Brothers had largely sourced the grapes for its trials. Saperavi was one of some 60 varieties Walpole had established during 1989 and 1990 as part of his 'variety collection'. He recalls using Jancis Robinson's book 'Vines, Grapes and Wines' as his guide on what to plant, noting the varieties she said were high quality or had quality potential and may work in his area. He subsequently sourced his cutting material from the CSIRO.

"On my place where the Saperavi vines are on own roots, it is a pathetic vine with extremely low vigour and short shoots if not pruned heavily. The act of grafting seems to invigorate it in every circumstance," Walpole notes.

## THE VITICULTURE

The Symphonia vineyard, now owned by Peter and Suzanne Evans, has a warm temperate climate of 1500 to 1600 degree-days with the hillside vineyard performing best. The majority of the Saperavi vines were top grafted from Cabernet Sauvignon on Schwarzmann rootstock nearly 20 years ago in 1995.

The vines are on well-drained red duplex soil which can lead to vigorous canopies in wetter seasons, and large bunches, particularly on spur-pruned vines. This has necessitated both bunch thinning and bunch reduction in those wetter seasons. Although individual bunches can be large, they are always

## SAPERAVI

By Peter Dry

Viticultural Consultant - The Australian Wine Research Institute

### BACKGROUND

Saperavi (sah-per-AR-vee) is a very old variety from south-west Georgia, near the Turkish border. It was widespread in western

Georgia by the 17th century as well as in the Kakheti region in the south-east of the country. Saperavi means 'dye' in Georgian, a reference to its black skin and

pink juice. Synonyms include Kleinberiger, Nerki Khagog and Saperavi. There are

currently 4751 hectares planted in Georgia where it is the third most important

winegrape variety and makes up 10% of the national vineyard area. It is the main

red wine variety and is said to be used for 80% of red wine production. It is the only

variety used in many of the highly regarded appellations in Georgia. There are

also 1514ha in Ukraine, 428ha in Kazakhstan, 716ha each in Moldova and Russia

and small areas in Bulgaria, Azerbaijan and Armenia. Outside of the aforementioned

countries, Australia may have the only commercial plantings: in 2013, there were 26

wine producers in 15 regions ranging from cool to hot, with most in the King Valley,

Alpine Valleys and McLaren Vale. Saperavi has been in Australia since the mid-

1970s but there was little commercial use until the late 1990s to early 2000s.

### VITICULTURE

Budburst is early to mid-season and maturity is mid to late. Vigour is low and yield

is moderate. Bunches are medium and loose with small to medium berries. Disease

tolerance is high and it is very winter-hardy. Pruning is generally to canes but

moderate yield is possible with spur pruning in Australia. Fruit hangs well on the

vine but berries are prone to shrivel. Saperavi is a very polymorphic variety with a

large degree of variation between clones—but at the present time there may be only

a single clone (111V10) in Australia.

### WINE

Wines have good colour and acid, and are full bodied with supple tannins. Good

flavour development is possible at moderate alcohol. It is a useful variety for adding

both colour and acidity to blends. Ageing potential is good. Descriptors include floral

(violets), dark fruits (blackberry, cherry), citrus and savoury. If the climate is too

cool, wines may be excessively acidic and sappy. Australian consumer reaction has

been very favourable.

For further information on this and other emerging varieties, contact Marcel Essling

(marcel.essling@awri.com.au or 08 8313 6600) at The Australian Wine Research

Institute to arrange the presentation of the Alternative Varieties Research to

Practice program in your region.

very loose, and reducing the size of the larger bunches is relatively easy.

We have found that arched cane canopies with eight-bud canes yield the

best results. The canopies are then quite open, well exposed, easy to work on, and

minimise disease. With their red flesh and thick skins, berries will yield the best

wine from the light exposed grapes. We understand this is also best practice in

Georgia.

The leaves of the Saperavi vines have a very furry back, and this can be an ideal

home for mites, particularly rust mites. Consequently, running a spray program

to minimise rust mite populations in the vineyard is essential.

The vines have shown evidence of virus infections in some seasons. We would strongly recommend any grower

contemplating growing Saperavi ensure that both bud material and rootstock are

virus free.

### THE WINEMAKING

The variety can tend towards an unattractive green flavour if not fully ripe.

It is typical of the Symphonia vineyard that phenological ripeness does not develop

until at least 14 Baume. The resulting

Thank you to Symphonia Wines' founder Peter Read, its former winemaker Robert Paul and Mark Walpole for their contributions to this article.

### ACKNOWLEDGEMENTS

tier Quintus wine.

Pressing occurs at dryness or soon after as there is no need for extended

maceration - although it could be interesting to trial.

Saperavi responds well to aerative rackings after pressing and before

barrel. Because it is such a deeply-flavoured wine, barrels with an equally

strong personality and a relatively high alcohol of +14.5% gives a round texture

which helps to soften the perceived tannin

profile.

Dense colour is a given so one doesn't need to work the cap hard, in fact,

Fermentation is undertaken in small open fermenters with gentle plunging

throughout and aerative pump-overs during the peak of the fermentation.

Temperature are maintained between 24-27°C.
